### Roofs and façades made of metal withstand all adversities

Even in Germany weather influences are becoming more and more extreme. Violent storms and thunderstorms have caused extensive damage on buildings in the recent past. Especially traditional roofing materials often cannot withstand these conditions. That is why metal roofing is a viable alternative. With the skilful and careful fixture the shingles can withstand even violent storms. The same positive characteristics apply to metal façades. Apart from being resistant to weather influences these also are robust and easy to keep clean.

By now metal is one of the most popular building materials in Germany. One big advantage of the material is its flexible design possibilities even for architecturally demanding designs. Moreover metal fits well into a building's design and gives it a high-quality look. Due to metal's great formability even complicated building geometries can be realized and with regard to colours the shingles can be customized to meet the builder's expectations. However, that is not all. Metal also scores in terms of resistance when it comes to weather conditions as well as other environmental influences.

Roofing often is exposed to unique and extreme weather conditions such as intense rainfall, hail, snow and storms with high wind speeds. All of these become more and more common in Germany. The resulting damages are running into millions in Germany every year. The most dangerous in unique weather conditions are roofing elements, which can be flung off roofs by strong winds. That can result in serious personal injuries and material damage. Boehme Systems offers the secure solution with its specially mounted metal shingles. "The shingles are secured by special clips, which ensure an easy installation as well as firm anchorage", says managing director Andreas Stengl. In comparison to conventional roof tiling the metal shingles can be mounted a

lot quicker, which saves time and money. Furthermore anchoring the shingles with clips makes drilling through the shingles unnecessary. As a result no water can penetrate through the roof and the risk of moisture damages is minimized.

Façades made of metal also provide the necessary protection from dirt as a result of frost or driving rain as well as an impressive exterior look. In addition it is easy to clean the façades when dirty. The metal furthermore creates an optimal room-climate with its combination of the underlying thermal insulation. As a result it is comfortably cool in summer and warmth is kept inside the house in winter. Another important aspect today is the concept of sustainability. Metal as a building material is 100% recyclable and with that it protects the environment.

Private builders and house owners can gain further information for concrete building projects as well as the use of metal at their local roofing and façade construction firm.

#### About Boehme Systems:

Boehme Systems Vertriebs GmbH specialises in the development, manufacture and supply of innovative building claddings made from metal. The company sees itself as a system provider who develops solutions for facades and roofs that make architectural and economic sense, giving due consideration to all important surrounding factors. The products are manufactured in the company's own production facilities which are equipped with state-of-the-art technologies. In addition to standardized solutions from its extensive product portfolio, Boehme Systems repeatedly develops individual solutions that offer architects and tradesmen a maximum degree of design freedom. A team of master tradesmen, fitting instructors, engineers and technicians ensure competent advice and service – from planning to execution.
